

Improving the well-being of farm animals

SHIELD Presents:
Advanced Feed Improvement Solutions
for Livestock Growers
Biological Solutions for Disease Prevention

SHIELD

EXCELLENT ANIMAL FARMING FOR EXCELLENT RESULTS

Animal Health begins with feed and animal farming

Global climate changes is damaging animal feed optimization. These changes have economic ramifications, including a reduction in the production potential of livestock. While environmental changes are not within our control, maintaining feed quality and a disease-prevention in Animal farming is not only our expertise – it is our mission.

With advanced technologies and together with the leading professionals in the field, Shield has produced vitamin premixes, complementary feed additives, and biologicals to improve the animal farming, enhance efficiency, help attain optimal absorption of nutrients, and provide biological protection against pathogens, mycotoxins and other pollutants.

When knowledge and experience meet science

All Shield products are the result of decades of experience and many studies, establishing that feed improved by our products, such as our disease-preventing biologicals, increases the production by maximizing the potential of the livestock. Our solutions prevent disease and (unnecessary) medical expenses, by helping to form a higher quality Animal farming for growers. Shield Biologics works closely with expert nutritionists, veterinarians, feed mills and academic researchers. We make a point to remain current with all developments and innovations in the field.

Join and thrive

Hundreds of growers are using Shield' excellent feed additives and already enjoy an optimized animal production: eggs, milk, and meat that are safer, healthier, and more nutritional to humans than ever before. Now it is your turn to join Shield's excellent feed program and Animal farming prevention of diseases.

Cooperation with global companies

Shield Biologics develops biologic products and feed enhancers in cooperation with associates in other countries and currently seeks to expand commercial and scientific partnerships with global companies in growing economies.
